

Galileo Tutorial Using Python on Galileo Senzations 2014

*Biograd na Moru
1. September 2013*

What will you make?

Alex Gluhak
Intel Labs Europe

Learning goals

Getting started with Python on Galileo

- Running Python interpreter and scripts
- Importing and using modules

I/O basics in Python

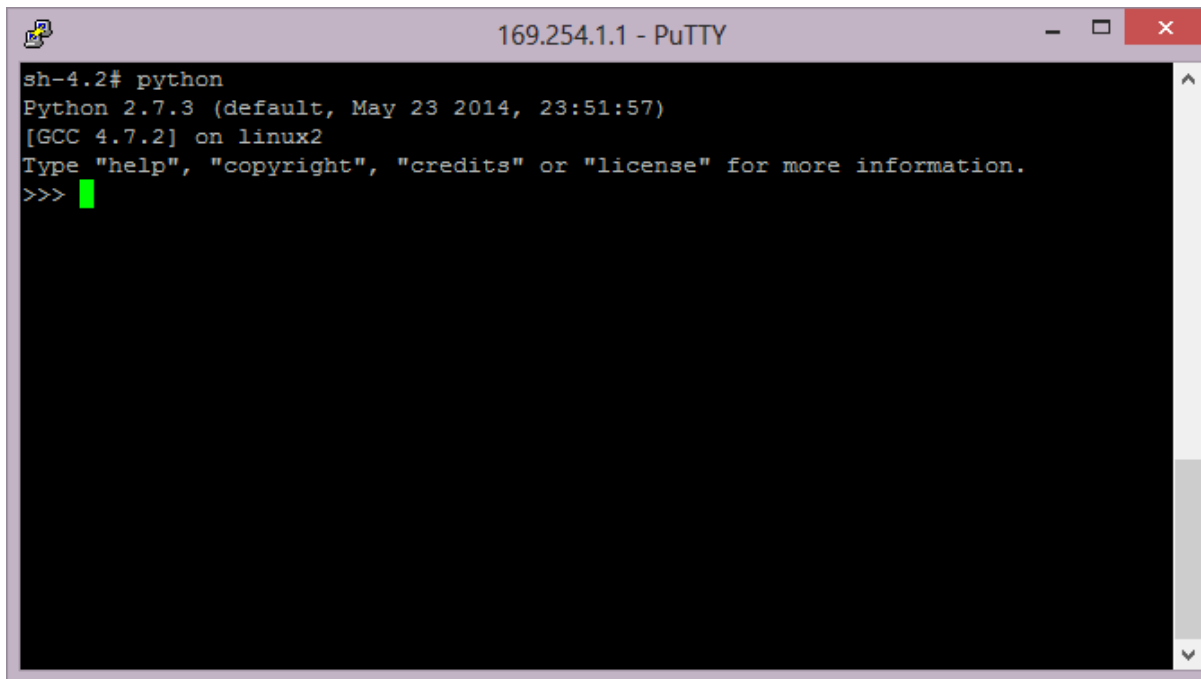

- Serial I/O
- Analog and digital I/O

Network communication using MQTT

Getting started with Python on Galileo

Python interpreter

- Connect to your Galileo via Ethernet
 - Restore sketch for port configuration if it does not work any more
 - Launch: *python* or *python2*
 - Leave: *Ctrl+D* or *exit()*

The image shows a PuTTY terminal window titled "169.254.1.1 - PuTTY". The terminal output is as follows:

```
sh-4.2# python
Python 2.7.3 (default, May 23 2014, 23:51:57)
[GCC 4.7.2] on linux2
Type "help", "copyright", "credits" or "license" for more information.
>>> █
```

Launching the Python interpreter

- Creating a simple “hello world” script

```
root@clanton:~# vi hello.py // test internet connectivity

Press “i”           // insert
Type print “hello world”
Press “ESC”         // exit insert mode
Press “:w”          // write to file
Press “:q”          // quit
```

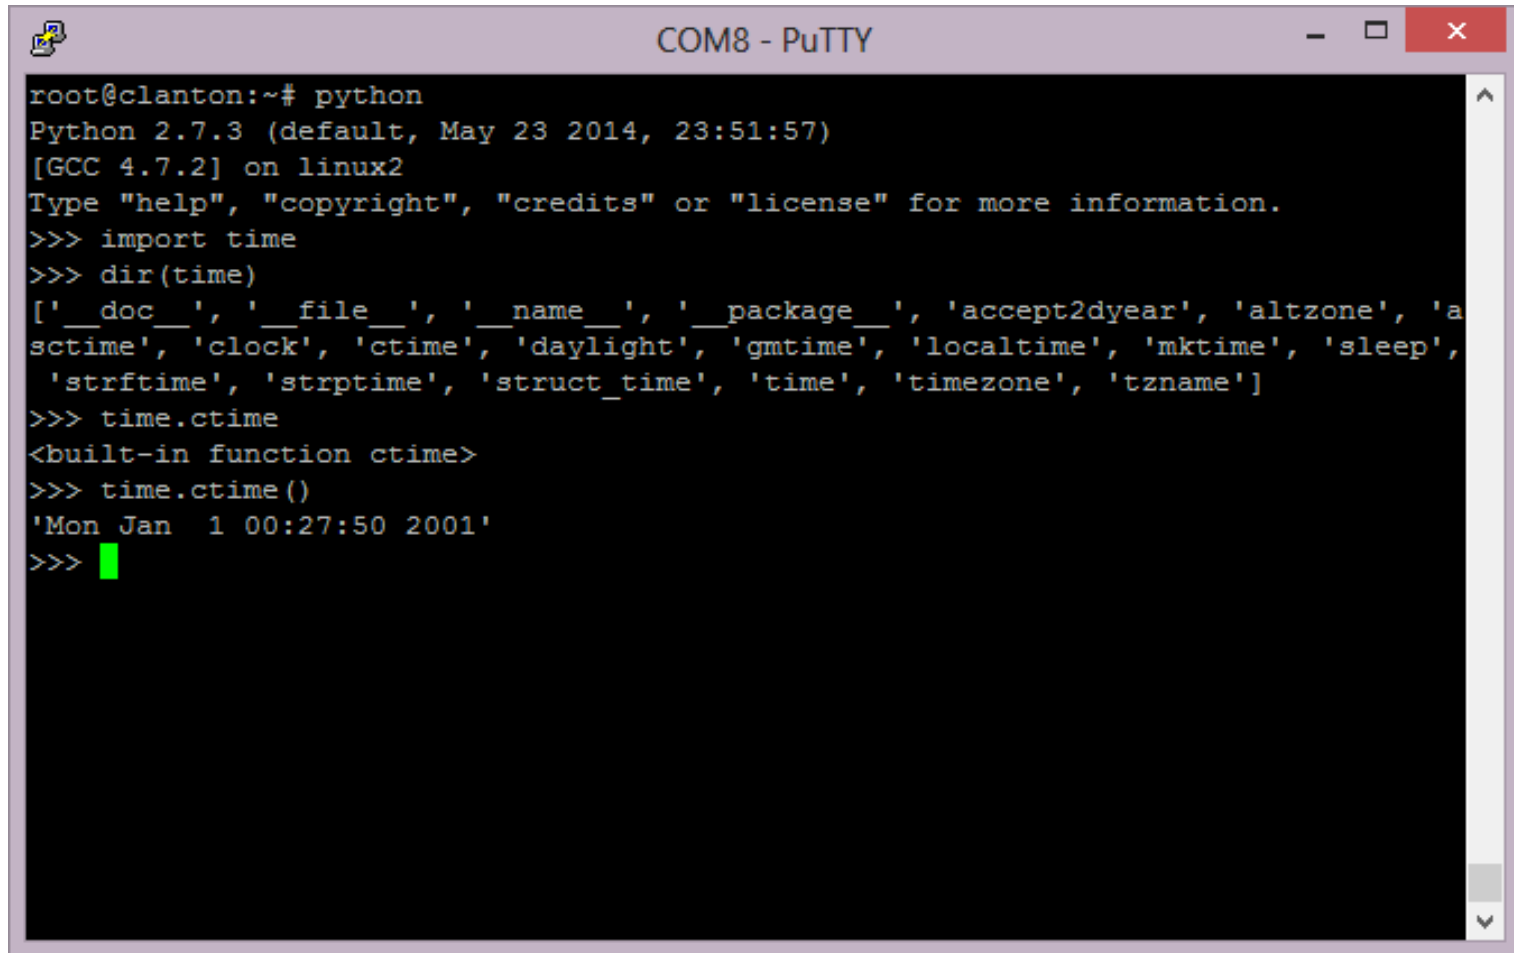

- Launching “Hello world” script

```
root@clanton:~# python hello.py // “hello world”
```

Python modules

- A module is a file containing Python definitions and statements.
- Modules is a way of sharing code efficiently across different scripts
- Python comes with a library of useful standard modules
 - See library reference: <https://docs.python.org/2/library/index.html>
- Modules can be imported in other modules and accessed inside
 - Syntax: **import** *module_name*
- Modules can contain functions, variables, etc –
 - Syntax: **dir**(*module_name*) // list the
- New modules can be installed from repositories using `easy_install`
 - Syntax: `easy_install module_name`

Importing and using modules

```
COM8 - PuTTY
root@clanton:~# python
Python 2.7.3 (default, May 23 2014, 23:51:57)
[GCC 4.7.2] on linux2
Type "help", "copyright", "credits" or "license" for more information.
>>> import time
>>> dir(time)
['_doc__', '__file__', '__name__', '__package__', 'accept2dyear', 'altzone', 'asctime', 'clock', 'ctime', 'daylight', 'gmtime', 'localtime', 'mktime', 'sleep', 'strftime', 'strptime', 'struct_time', 'time', 'timezone', 'tzname']
>>> time.ctime
<built-in function ctime>
>>> time.ctime()
'Mon Jan  1 00:27:50 2001'
>>> █
```

Exercise: using modules

- Extend your hello world script by printing the current system time after a delay of 5 seconds

Hint: look into the time module for a function that can be used for delay

Analog and Digital I/O in Python

Digital and analog I/O using python

- Module with Arduino style syntax pre-installed
 - Name: pyGalileo
 - Source: <https://github.com/galileo-chofrock/pyGalileo>

```
pinMode(pin, direction) // pin number, INPUT/OUTPUT"
```

```
digitalWrite (pin, value) // pin number, HIGH/LOW
```

```
digitalRead (pin) // pin number
```

```
analogWrite (pin, value) // PWM pin number, value from 0..255
```

```
analogRead (pin) // analog PIN number (A0 ...A5)
```

```
wait (time) // time in milliseconds
```

Exercise: Digital write

1. Connect Grove LED to D2

2. Write a python script to make it blink every second

Hints:

- If you are not familiar with the vi editor you can use your favourite on the PC and copy the file over via SFTP
- You can use the python interpreter first to experiment with the module

Exercise: Analog read

1. Connect Grove Light / Rotary angle sensor to A0
2. Write a python script to print out the reading every second

Hints:

- If you are not familiar with the vi editor you can use your favourite on the PC and copy the file over via SFTP
- You can use the python interpreter first to experiment with the module

Serial communications on Galileo using Python

Serial communications in Python

- Python serial module pre-installed
 - Name: pySerial
 - Use: import serial
 - Source: <http://pyserial.sourceforge.net/>
- Main principles
 - Open a serial port on the Galileo
 - Perform read/write operations
 - Close port when you are done
- Serial Linux devices on Galileo
 - /dev/ttyS0 – UART0 (Pins: 0/1)
 - /dev/ttyS1- UART1 (3.5 mm jack)
 - /dev/ttyGS0 – serial port to Arduino IDE console

pySerial API overview

Serial (device, baudrate) // create serial port object and return it

inWaiting() // returns number of bytes received

read (number of bytes) // read number of bytes and return them

write (msg) // write msg buffer, e.g a string

close () // close created serial port

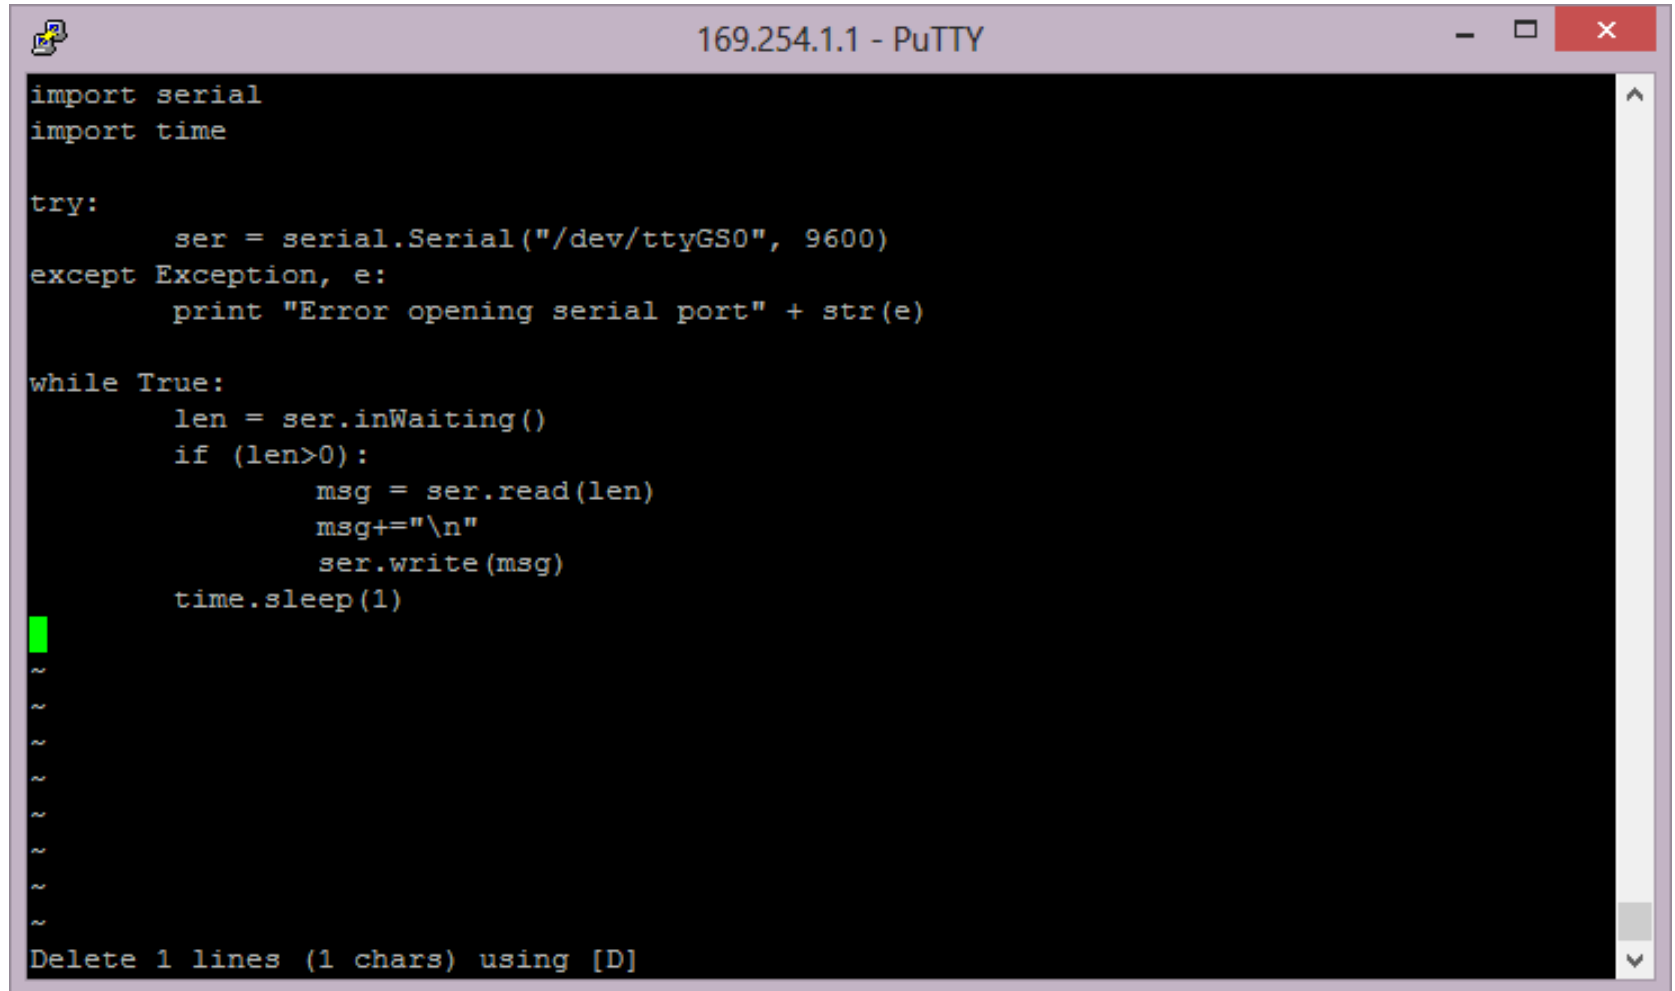

Detailed API: http://pyserial.sourceforge.net/pyserial_api.html

Exercise: Serial echo server

1. Write a basic echo server that connects to the serial monitor of the ArduinoDev UI
2. Send messages from the ArduinoDev UI to the echo server

Solution - echoserver.py

```
169.254.1.1 - PuTTY

import serial
import time

try:
    ser = serial.Serial("/dev/ttyGS0", 9600)
except Exception, e:
    print "Error opening serial port" + str(e)

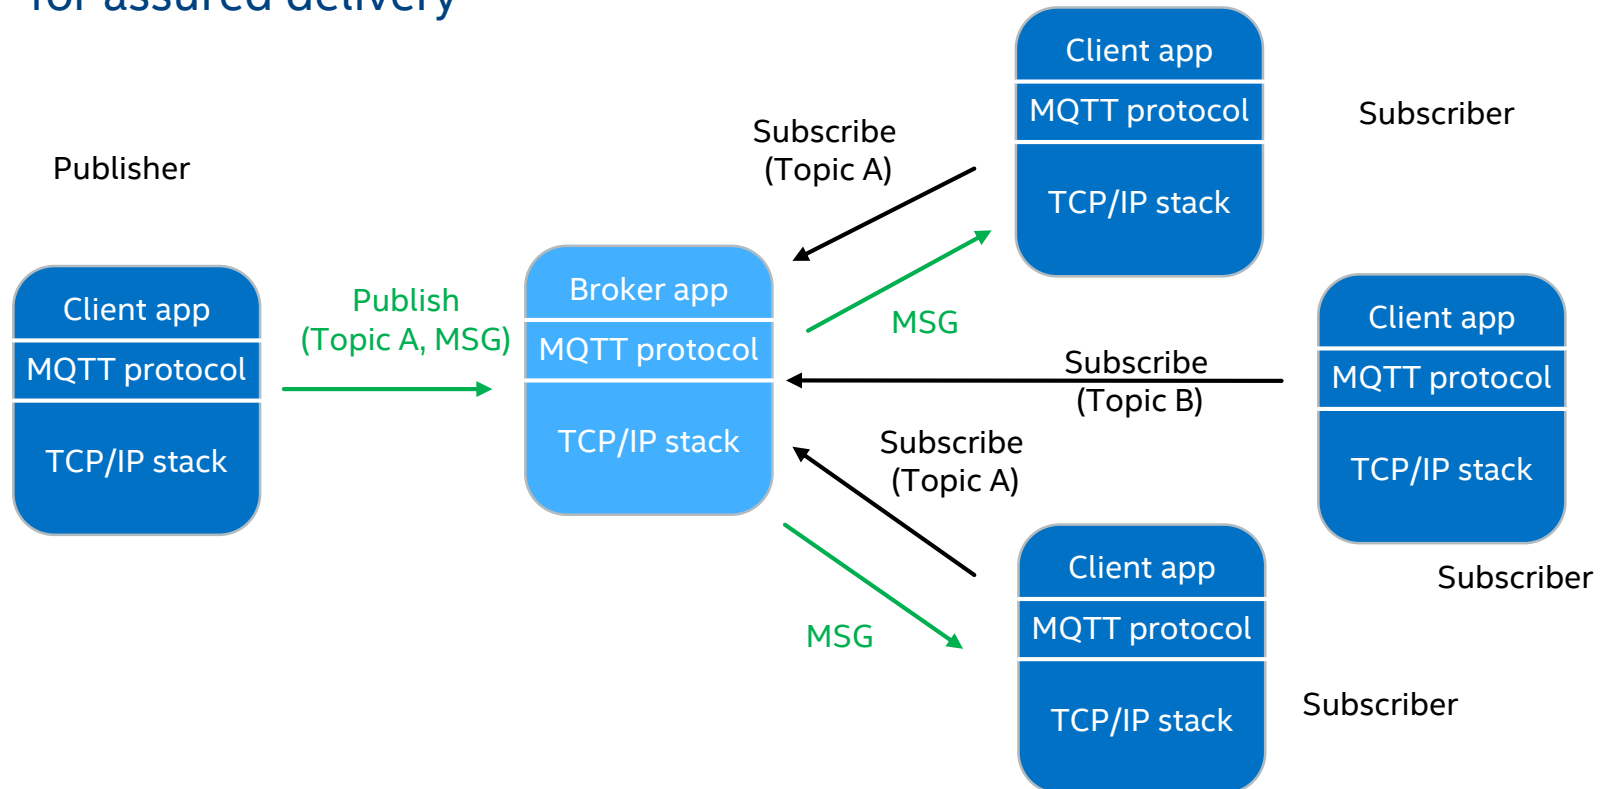

while True:
    len = ser.inWaiting()
    if (len>0):
        msg = ser.read(len)
        msg+="\n"
        ser.write(msg)
    time.sleep(1)

```

Network communications using MQTT

MQTT Overview

- IoT/M2M connectivity protocol
 - Very lightweight publish/subscribe messaging transport
 - Minimizes network bandwidth and device resource requirements whilst and provides some degree of reliability for assured delivery

MQTT protocol basics

- 2 Byte fixed header
 - 14 Message types
 - 3 QoS levels (at most once, at least once, exactly once)

Bit	7	6	5	4	3	2	1	0
Byte 1	MESSAGE TYPE				DUP flag	QOS LEVEL		RETAIN
Byte 2	REMAINING LENGTH							

- Topic
 - Topic name is the key that identifies the information channel to which payload data is published
 - Topic names are UTF encoded and an upper length limit of 32,767 char
- Payload can be of varying length

Topic names

- A topic name is a string of varying length
- To allow subscription to multiple topics at once, a tree hierarchy can be introduced with a topic level separator “/”

“/BuildingA/Floor1/Room1”	(1)
“/BuildingA/Floor1/Room1/Light”	(2)
“/BuildingA/Floor1/Room1/Temperature	(3)

- Wild cards can be used to subscribe to a subset of the hierarchy tree
 - Multilevel wild card “#”
 - “/BuildingA/Floor1/Room1/#” subscribes to topics (2) and (3)
 - “/BuildingA/Floor1/#” subscribes to topics (1)-(3)
 - Single level wild card “+”
 - “/BuildingA/Floor1/+/Light” subscribe to light from all rooms on Floor1

MQTT in Python

- mosquitto library (<http://mosquitto.org/>)

```
# create a mosquito client instance
mqttc = mosquitto.Mosquitto()

# Connect call backs to functions implementing them
mqttc.on_message = on_message
mqttc.on_connect = on_connect
mqttc.on_publish = on_publish
mqttc.on_subscribe = on_subscribe

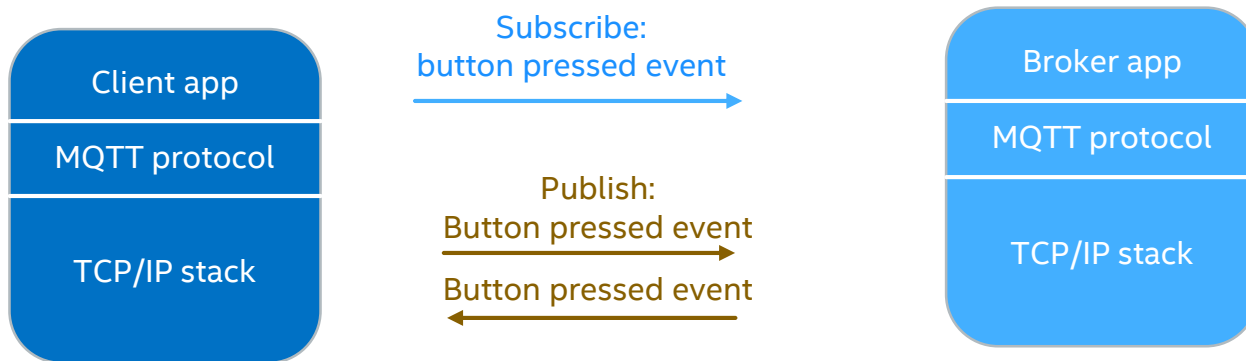

# connect to a mosquitto broker
mqttc.connect(broker_address, port)

# listen for messages in a loop
mqttc.loop(1) or mqttc.loop_forever()

# publish a message
mqttc.publish(topic, msgbody)
```

Exercise

1. Look at the mqttGalileo example and run it
 - Code demonstrates both subscriber and publisher part in one client

2. Adapt the code to exchange information or trigger some action with one or more neighbouring Galileos
